Founder: Prof. Dr. S. B. Mujumdar, M. Sc., Ph. D. (Awarded Padma Bhushan and Padma Shri by President of India)

Case Study : 7

1. Title: To Demonstrate Event Handling in JavaScript Using Form Elements and Input Validation.

2. Software/Tools Required: HTML, VS Code.

3. Theory: Event handling in JavaScript is used to respond to user actions on a webpage. In this experiment, HTML is used to create a student registration form, CSS is used for styling, and JavaScript is used to access and manipulate form elements. Different events such as focus, change, and submit are implemented. JavaScript validates user input, checks for empty fields, and verifies the email format before displaying the result.

4. Output:

The screenshot shows a web browser window with multiple tabs. The active tab is titled 'JavaScript Event Handling'. The address bar shows the URL '127.0.0.1:5500/index.html'. The main content area displays a 'Student Registration Form' with the following fields:

- Name:** A text input field containing 'Priya prasad'.
- Email:** A text input field containing 'priyaprasad@gmail.com'.
- Course:** A dropdown menu with 'Computer Science' selected.
- Submit:** A green button labeled 'Submit'.

Below the form, a green message states: 'Form submitted successfully!'.

Conclusion : In this experiment, we successfully implemented event handling in JavaScript using a student registration form. We learned how to access form elements, handle focus, change, and submit events, and validate user inputs. This experiment helped us understand how JavaScript makes webpages interactive and user-friendly.
